

Pilanesberg Species Lists

Pilanesberg is located within the transition zone between the dry Kalahari and the wetter Lowveld vegetation, commonly referred to as Bushveld. Unique overlaps of mammals, birds and vegetation occur because of this transition zone.

There is a fascinating combination of geology, landscape and rainfall which give rise to different patterns of vegetation - wide open grasslands, steep hill slopes, rocky outcrops, wooded valleys, thickets and thickly wooded gorges.

Pilanesberg accommodates virtually every mammal of southern Africa and is also home to healthy populations of lion, leopard, black and white rhino, elephant and buffalo - Africa's Big Five. A wide variety of rare and common species exist here such as the nocturnal brown hyaena, the fleet-footed cheetah and the majestic sable.

Bird watching is excellent with over 300 species recorded. Some are migrants, others permanent inhabitants; some eat carrion or live prey, others eat seeds, fruit or tiny water organisms.

Amphibian List

Amphibians are the most primitive class of land-living vertebrates, being the first vertebrate animals to inhabit the land. The class Amphibia, which comprises more than 4,700 species, is represented in South Africa by the order Anura, a group of tailless amphibians commonly referred to as frogs or toads.

Frogs have adapted to habitats ranging from mountain tops to sea level and from forests to deserts, and some are completely terrestrial whereas others are largely aquatic. South African frogs belong to 10 families and over 50% of the 115 or so species occur nowhere else. Frogs form the prey of various birds, mammals, reptiles, fish and even other frogs, and contribute to the control of insect pests and other invertebrates which they consume in large numbers.

Pilanesberg Game Reserve has over 18 frog/ toad species.

Geology List

The rare rock types and the structure of Pilanesberg make it a unique geological feature. The following geological types occur in Pilanesberg:

ROCK TYPE	DESCRIPTION
Volcanic Tuff	Rocks composed of volcanic ejecta, such as broken pieces of volcanic glass, phenocrysts, rock fragments, etc.
Nepheline Syenite	A plutonic rock resembling syenite but containing nepheline and lacking quartz
Lava	Solid rock resulting from cooling of hot molten or semi-fluid rock erupted from a volcano or fissure
Kimberlite	A rare, blue-tinged, coarse-grained intrusive igneous rock sometimes containing diamonds, found in South Africa and Siberia
Foyaite	The foyaite found in the Pilanesberg have different names due to their different mineral compositions. Four varieties of foyaite are identified in Pilanesberg and are called White Foyaite (a coarse-grained rock which crystallised slowly from molten magma inside the earth; it is rich in minerals), Red Foyaite (created when ultra-heated water altered the color & composition of rock), Green Foyaite (nepheline in this rock dissolves and results in a pitted surface) and Ledig Foyaite (also called "Green nepheline syenite").
Red Syenite	There many varieties of syenite. Red syenite makes good polished facing stone.

Florite	Signs of the mining of purple florite can be found in the Reserve. The minerals in these rocks are also a result of ultra-heated water soaked up by the rocks.
Uranium-bearing Tuff	Rocks that are mildly radioactive due to its uranium content. The minerals in these rocks are also a result of water soaking into the rocks at the end of the active life of the volcano.
Geological sites (indicated on maps of the Reserve) contain some cut and polished rock surfaces.	

List of Grasses

Grasses belong to one of the largest plant families in the world with over 10,000 species world-wide. About 1,000 species have been described in Southern Africa, of which just over 300 are endemic to the region and only about 100 have been introduced.

Pilanesberg's grasslands are typically African Savannah.

Tree List

Pilanesberg National Park exists within the transition zone between the dry Kalahari and wetter Lowveld vegetation, commonly referred to as "Bushveld". Unlike any other large park, unique overlaps of mammals, birds and vegetation occur because of this transition zone.
